TREATMENT OF CLIENTS WITH LUNG TUBERCULOSIS THE PROBLEM OF INEFFECTIVENESS BREATHING CLEANING (Study In The General Hospital Bangil Pasuruhan Area)

Introduction Pulmonary Inherculosis is a contagious disease caused by the bacterial infection of Mycobacterium unberculosis in the respiratory tract. It is often found in people who live in prox sanitary and densely populated environments. Based on the medical record of Bangil Passuman Hospital, Lung Tuherculosis was ranked first, he number of impairm medicility in 2014 was 225 patients. The aim is to provide marsing care to clients with pulmonary subocculosis with ineffective airway clearance. This method is a descriptive study with a cross sectional approach in the form of a case study. Data were collected by interviewing family, medical records, physical examination and support. The data collection intraments used the accept format compiled by the Naving DIII study program team. The results of the study on the two clients of pulmonary suborculosis found that the client had a
